

in the treatment of psychoses including schizophrenia. Doses are expressed in terms of the base; loxapine succinate 34 mg is equivalent to about 25 mg of loxapine.

The usual oral dose is 20 to 50 mg daily initially, in 2 divided doses, increased according to response over the next 7 to 10 days to 60 to 100 mg daily or more, in 2 to 4 divided doses; the maximum recommended dose is 250 mg daily. Maintenance doses are usually in the range of 20 to 60 mg daily, in divided doses. For the control of acute conditions it is given by intramuscular injection in daily doses of up to 300 mg in 2 or 3 divided doses. Reduced dosage may be required in elderly patients.

Loxapine has also been given orally and by intramuscular injection as the hydrochloride.

Disturbed behaviour. For a discussion of the use and limitations of antipsychotics such as loxapine in patients with disturbed behaviour, see p.954.

Medazepam (BAN, rINN)

Medatsepaam; Médazépam; Medazepamum. 7-Chloro-2,3-dihydro-1-methyl-5-phenyl-1H-1,4-benzodiazepine.

Medazepam

$C_{16}H_{15}ClN_2$ = 270.8.

CAS — 2898-12-6.

ATC — N05BA03.

ATC Vet — QN05BA03.

Pharmacopoeias. In *Jpn*.

Medazepam Hydrochloride (USAN)

Medazepam, hidrocloruro de; Ro-5-4556.

$C_{16}H_{15}ClN_2 \cdot HCl$ = 307.2.

CAS — 2898-11-5.

ATC — N05BA03.

ATC Vet — QN05BA03.

Profile

Medazepam is a long-acting benzodiazepine with properties similar to those of diazepam (p.986). It has been given for the short-term treatment of anxiety disorders (p.952). A usual oral dose is 10 to 30 mg daily in divided doses; in severe conditions up to 60 mg daily has been given. Reduced doses should be given to elderly or debilitated patients.

Medetomidine Hydrochloride (BANM, USAN, rINN)

Hidrocloruro de medetomidina; Medetomidinihydroklorid; Médétomidine, Chlorhydrate de; Medetomidinihydroklorid; Medetomidini Hydrochloridum; MPV-785. (±)-4-[1-(2,3-Xylyl)ethyl]imidazole monohydrochloride.

Медетомидина Гидрохлорид

$C_{13}H_{16}N_2 \cdot HCl$ = 236.7.

CAS — 86347-15-1 (medetomidine hydrochloride); 86347-14-0 (medetomidine).

Profile

Medetomidine is an α_2 -adrenoceptor agonist with sedative, muscle relaxant, and analgesic properties. It is used as the hydrochloride in veterinary medicine.

Its isomer dexmedetomidine (p.986) is used as the hydrochloride in intensive care.

Melperone Hydrochloride (BANM, rNNM)

FG-5111; Flubuperone Hydrochloride; Hidrocloruro de melperona; Melperon Hidroklorür; Melpérone, Chlorhydrate de; Melperoni Hydrochloridum; Methylperone Hydrochloride. 4'-Fluoro-4-(4-methylpiperidino)butyrophenone hydrochloride.

Мелперона Гидрохлорид

$C_{16}H_{22}FNO \cdot HCl$ = 299.8.

CAS — 3575-80-2 (melperone); 1622-79-3 (melperone hydrochloride).

ATC — N05AD03.

ATC Vet — QN05AD03.

Profile

Melperone is a butyrophenone with general properties similar to those of haloperidol (p.1000). It is given as the hydrochloride by mouth or by intramuscular injection for the management of psychoses such as schizophrenia (p.955) and in disturbed behaviour (p.954); doses are expressed as the hydrochloride. A usual oral dose is up to 400 mg daily in divided doses. In acute conditions it may be given intramuscularly in doses of 25 to 100 mg repeated to a usual maximum of 200 mg daily.

Cardiac arrhythmias. Melperone has been reported to have class III electrophysiologic and antiarrhythmic activity^{1,2} but its clinical use as an antiarrhythmic would be limited by a high incidence of adverse effects.² For a discussion of the cardiovascular effects of antipsychotics in general, see under Chlorpromazine, p.970.

1. Mögelvang JC, *et al.* Antiarrhythmic properties of a neuroleptic butyrophenone, melperone, in acute myocardial infarction. *Acta Med Scand* 1980; **208**: 61-4.

2. Hui WKK, *et al.* Melperone: electrophysiologic and antiarrhythmic activity in humans. *J Cardiovasc Pharmacol* 1990; **15**: 144-9.

Pharmacokinetics. References.

1. Köppel C, *et al.* Gas chromatographic-mass spectrometric study of urinary metabolism of melperone. *J Chromatogr Biomed Appl* 1988; **427**: 144-50.

Schizophrenia. References¹⁻³ to the use of melperone in schizophrenia. It has been suggested that melperone should be considered as an atypical antipsychotic in view of the low incidence of extrapyramidal effects associated with its use.

Meprobamate (BAN, rINN)

Meprobamaatti; Meprobamát; Meprobamat; Meprobamatas; Méprobamate; Meprobamato; Meprobamatum; Meprostanum. 2-Methyl-2-propyltrimethylene dicarbamate.

Мепробамат

$C_9H_{18}N_2O_4$ = 218.3.

CAS — 57-53-4.

ATC — N05BC01.

ATC Vet — QN05BC01.

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of meprobamate: Miltown; Mother's little helper; Uncle Miltie.

Pharmacopoeias. In *Eur.* (see p.vii), *US*, and *Viet*.

Ph. Eur. 6.2 (Meprobamate). A white or almost white, crystalline or amorphous powder. Slightly soluble in water; freely soluble in alcohol.

USP 31 (Meprobamate). A white powder having a characteristic odour. Slightly soluble in water; freely soluble in alcohol and in acetone; practically insoluble or insoluble in ether. Store in airtight containers.

Dependence and Withdrawal

As for the barbiturates (see Amobarbital, p.962).

Adverse Effects and Treatment

Drowsiness is the most frequent adverse effect of meprobamate. Other effects include nausea, vomiting, diarrhoea, paraesthesia, weakness, and CNS effects such as headache, paradoxical excitement, dizziness, ataxia, and disturbances of vision. There may be hypotension, tachycardia, and cardiac arrhythmias. Hypersensitivity reactions occur occasionally. These may be limited to skin rashes, urticaria, and purpura or may be more severe with angioedema, bronchospasm, or anuria. Erythema multiforme or Stevens-Johnson syndrome, and exfoliative or bullous dermatitis have been reported.

Blood disorders including agranulocytosis, eosinophilia, leucopenia, thrombocytopenia, and aplastic anaemia have occasionally been reported.

Overdose with meprobamate produces symptoms similar to those of barbiturate overdose (see Amobarbital, p.962), and is managed similarly.

Overdose. Two children aged 2 and 2.5 years recovered with conservative management alone after overdose of meprobamate with bendroflumethiazide despite measured plasma-meprobamate concentrations of 170 and 158 micrograms/mL, respectively.¹ Although it had been recommended that haemoperfusion should be considered at plasma-meprobamate concentrations above 100 micrograms/mL, the authors considered that experience with adults suggested haemoperfusion should normally only be considered at plasma concentrations above 200 micrograms/mL.

1. Dennison J, *et al.* Meprobamate overdose. *Hum Toxicol* 1985; **4**: 215-17.

Precautions

Meprobamate should be used with caution in patients with hepatic or renal impairment, depression, muscle weakness, and, as with all sedatives, in patients with impaired respiratory function. Meprobamate should be given with care to elderly or debilitated patients. Meprobamate may induce seizures in patients with a history of epilepsy.

Meprobamate may cause drowsiness; affected patients should not drive or operate machinery.

Breast feeding. The *BNF* considers that the use of meprobamate should be avoided in breast feeding mothers as concentrations in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in the infant.

Porphyria. Meprobamate has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Pregnancy. Studies on the use of meprobamate during pregnancy.

1. Milkovich L, van den Berg BJ. Effects of prenatal meprobamate and chlorthalidone hydrochloride on human embryonic and fetal development. *N Engl J Med* 1974; **291**: 1268-71.

2. Crombie DL, *et al.* Fetal effects of tranquilizers in pregnancy. *N Engl J Med* 1975; **293**: 198-9.

3. Hartz SC, *et al.* Antenatal exposure to meprobamate and chlorthalidone in relation to malformations, mental development, and childhood mortality. *N Engl J Med* 1975; **292**: 726-8.

Interactions

The sedative effects of meprobamate are enhanced by CNS depressants including alcohol. Meprobamate is capable of inducing hepatic microsomal enzyme systems involved in drug metabolism: the metabolism of other drugs may be enhanced if given concurrently.

Pharmacokinetics

Meprobamate is readily absorbed from the gastrointestinal tract and peak plasma concentrations occur 1 to 3 hours after ingestion. Meprobamate is widely distributed. It is extensively metabolised in the liver and is excreted in the urine mainly as an inactive hydroxylated metabolite and its glucuronide conjugate. About 10% of a dose is excreted unchanged. Meprobamate has a half-life reported to range from about 6 to 17 hours, although this may be prolonged after chronic use.

It diffuses across the placenta and appears in breast milk at concentrations of up to 4 times those in the maternal plasma.

Uses and Administration

Meprobamate is a carbamate with hypnotic, sedative, and some muscle relaxant properties, although in therapeutic doses its sedative effect rather than a direct action may be responsible for muscle relaxation. It has been used in the short-term treatment of anxiety disorders (p.952) and also for the short-term management of insomnia (p.957) but has largely been superseded by other drugs. Meprobamate has sometimes been used, alone or

with an analgesic, in the management of muscle spasm (p.1887) and painful musculoskeletal disorders but such use is no longer considered appropriate.

The usual anxiolytic dose is 400 mg orally three or four times daily to a maximum of 2.4 g daily. In elderly patients, no more than half the usual adult dose has been suggested.

Preparations

$C_{21}H_{26}N_2OS_2 \cdot C_6H_6O_3S = 544.7$.

CAS — 32672-69-8 (mesoridazine besilate).

ATC — N05AC03.

ATC Vet — QN05AC03.

Pharmacopoeias. In US.

USP 31 (Mesoridazine Besylate). A white to pale yellowish powder having not more than a faint odour. Soluble 1 in 1 of water, 1 in 11 of alcohol, 1 in 3 of chloroform, and 1 in 6300 of ether; freely soluble in methyl alcohol. pH of a freshly prepared 1 in 100 solution is between 4.2 and 5.7. Store in airtight containers. Protect from light.

Profile

Mesoridazine is a phenothiazine with general properties similar to those of chlorpromazine (p.975). It has a piperidine side-chain and is a metabolite of thioridazine (p.1031). Mesoridazine has usually been given as the besilate, orally or by intramuscular injection.

Mesoridazine has been shown to prolong the QT interval in a dose-related manner which increases the risk of life-threatening arrhythmias such as torsade de pointes and sudden death; consequently its use in schizophrenia has been restricted. Details of these restrictions are given under Precautions of Thioridazine, the parent drug of mesoridazine (see p.1031). Its use in other psychiatric disorders was abandoned after it was felt that there was an unacceptable balance of risks and benefits as a result of its cardiotoxic potential, and it is no longer available in many countries.

Breast feeding. The American Academy of Pediatrics¹ considers that, although the effect of mesoridazine on breast-fed infants is unknown, its use by mothers during breast feeding may be of concern since antipsychotic drugs do appear in breast milk and thus could conceivably alter CNS function in the infant both in the short and long term.

Метакхалон

$C_{18}H_{14}N_2O = 250.3$.

CAS — 72-44-6 (methaqualone); 340-56-7 (methaqualone hydrochloride).

ATC — N05CM01.

ATC Vet — QN05CM01.

NOTE. The following terms have been used as 'street names' (see p.vi) or slang names for various forms of methaqualone: 300's; 714; 714s; Bandits; Beiruts; Blou Bulle; Blue Balls; Blue bulls; Disco biscuits; Down and dirty's; Drunfos; Drunken Monkey; Ewings; Flamingos; Flowers; Four-strokes; Fuckers; Genuines; Germans; Golfsticks; Gorilla Biscuits; Humbles; Joe Fridays; Knoppies; Lemmon 714; Lemons; Lennons; Lewds; Lizards; Loss-of-memory; Love drug; Lovers; Ludes; Luds; Lula; Magwheels; Pressouts; Pupumala; Q; Qua; Quaa; Quaalude; Quaaludes; Quaa's; Quack; Quads; Quas; Seven fourteens; Shiny Tops; Soaper; Sopor; Sopors; Sporos; Strawberries; Super Sopors; Supers; Supper; Three hundreds; Vitamin Q; Wagon Wheels; Wallbangers; Whore pills.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Methaqualone). A white or almost white, crystalline powder. Very slightly soluble in water; soluble in alcohol; dissolves in dilute sulfuric acid. Protect from light.

Profile

Methaqualone is a quinazolinone derivative with hypnotic and sedative properties. It has been given orally in the short-term management of insomnia but the use of methaqualone for this purpose is no longer considered appropriate. It has also been given with diphenhydramine for an enhanced effect.

Methaqualone has been withdrawn from the market in many countries because of problems with abuse.

Adverse effects and symptoms of overdosage are similar to those of barbiturates (see Amobarbital, p.962) although cardiac and respiratory depression reportedly occur less frequently.

Abuse. Although oral abuse of methaqualone has greatly declined in developed countries after the widespread withdrawal of the tablets, smoking of (usually illicitly manufactured) methaqualone, generally in combination with cannabis and tobacco, is a major public health problem in South Africa, and some other parts of Africa and India. Although diazepam has been used to manage dependence, controlled studies to inform the management of the condition are lacking.¹

1. McCarthy G, *et al.* Treatment for methaqualone dependence in adults. Available in The Cochrane Database of Systematic Reviews; Issue 2. Chichester: John Wiley; 2005 (accessed 11/05/06).

Preparations

Proprietary Preparations (details are given in Part 3)

Mexazolam (rINN)

CS-386; Methylcloxazolam; Mexazolamum. 10-Chloro-11b-(2-chlorophenyl)-2,3,7,11b-tetrahydro-3-methylxazolo[3,2-d][1,4]benzodiazepin-6(5H)-one.

Мексазолам

$C_{18}H_{16}Cl_2N_2O_2 = 363.2$.

CAS — 31868-18-5.

Profile

Mexazolam is a benzodiazepine with general properties similar to those of diazepam (p.986). It has been given by mouth for its anxiolytic and sedative properties.

Preparations

Proprietary Preparations (details are given in Part 3)

Port.: Sedoxil.

Midazolam (BAN, rINN)

Midatsolaami; Midazolám; Midazolamas; Midazolamum; Ro-21-3971. 8-Chloro-6-(2-fluorophenyl)-1-methyl-4H-imidazo[1,5-d][1,4]benzodiazepine.

Мидазолам

$C_{18}H_{13}ClFN_3 = 325.8$.

CAS — 59467-70-8.

ATC — N05CD08.

ATC Vet — QN05CD08.

Pharmacopoeias. In *Eur.* (see p.vii).

Ph. Eur. 6.2 (Midazolam). A white or yellowish crystalline powder. Practically insoluble in water; freely soluble in alcohol and in acetone; soluble in methyl alcohol.

Midazolam Hydrochloride (BANM, USAN, rINNM)

Hidrocloruro de midazolam; Midazolam, Chlorhydrate de; Midazolami Hydrochloridum; Ro-21-3981/003.

Мидазолама Гидрохлорид

$C_{18}H_{13}ClFN_3 \cdot HCl = 362.2$.

CAS — 59467-96-8.

ATC — N05CD08.

ATC Vet — QN05CD08.

Incompatibility. The visual compatibility of midazolam hydrochloride with a range of drugs was studied over a period of 4 hours.¹ A white precipitate was formed immediately with dimenhydrinate, pentobarbital sodium, perphenazine, prochlorperazine edisilate, and ranitidine hydrochloride. Similar incompatibility has been reported^{2,3} with furosemide, thiopental, and parenteral nutrition solutions. Other workers⁴ have reported that a precipitate is formed with midazolam hydrochloride if the resultant mixture has a pH of 5 or more.

1. Forman JK, Souney PF. Visual compatibility of midazolam hydrochloride with common preoperative injectable medications. *Am J Hosp Pharm* 1987; **44**: 2298–9.
2. Chiu MF, Schwartz ML. Visual compatibility of injectable drugs used in the intensive care unit. *Am J Health-Syst Pharm* 1997; **54**: 64–5.
3. Trissel LA, *et al.* Compatibility of parenteral nutrient solutions with selected drugs during simulated Y-site administration. *Am J Health-Syst Pharm* 1997; **54**: 1295–300.
4. Swart EL, *et al.* Compatibility of midazolam hydrochloride and lorazepam with selected drugs during simulated Y-site administration. *Am J Health-Syst Pharm* 1995; **52**: 2020–2.

Stability. Licensed product information states that solutions of midazolam hydrochloride in sodium chloride 0.9%, glucose 5%, or glucose 4% with sodium chloride 0.18% are stable at room temperature for up to 24 hours, and similar solutions containing the equivalent of 0.5 mg/mL of the base were stable for 36 days¹ when stored in glass bottles at temperatures of 4° to 6°, 24° to 26°, and 39° to 41°. Other workers² found that a solution containing midazolam hydrochloride equivalent to 1 mg/mL of the base in sodium chloride 0.9% was stable for at least 10 days when stored in PVC bags. The product information advises against admixture with Compound Sodium Lactate Intravenous Infusion (Hartmann's solution) as the potency of midazolam is reduced.
