Methylbenzethonium Chloride (BAN, rINN)

Cloruro de metilbencetonio; Methylbenzethonii Chloridum; Méthylbenzéthonium, Chlorure de. Benzyldimethyl-2-{2-[4- $\hbox{(1,1,3,3-tetramethylbutyl)-} \emph{o-tolyloxy}] ethoxy} ethylammonium$ chloride monohydrate.

Метилбензетония Хлорид

 $\rm C_{28}H_{44}CINO_2,H_2O=480.1$. CAS — 25155-18-4 (anhydrous methylbenzethonium chloride); 1320-44-1 (methylbenzethonium chloride monohydrate).

Pharmacopoeias. In US.

USP 31 (Methylbenzethonium Chloride). White hygroscopic crystals with a mild odour. Soluble 1 in 0.8 of water, 1 in 0.9 of alcohol, 1 in more than 10 000 of chloroform, and 1 in 0.7 of ether. Solutions are neutral or slightly alkaline to litmus. Store in airtight containers.

Profile

Methylbenzethonium chloride is a quaternary ammonium disinfectant and antiseptic with actions and uses similar to those of other cationic surfactants (see Cetrimide, p.1634). It is used topically for minor infections or irritation of the skin.

Leishmaniasis. Topical treatment of cutaneous leishmaniasis (p.824) with methylbenzethonium chloride 5 or 12% and paromomycin sulfate has proved beneficial.

Preparations

USP 31: Methylbenzethonium Chloride Lotion; Methylbenzethonium Chloride Ointment; Methylbenzethonium Chloride Topical Powder.

Proprietary Preparations (details are given in Part 3)

Multi-ingredient: Israel: Leshcutan; Ital.: Traumicid†; Mex.: Norforms†; USA: Acnotex; Dermasept Antifungal; Drytex; Finac; Orasept.

Methylrosanilinium Chloride (BAN, rINN)

CI Basic Violet 3; Cloruro de metilrosanilina; Colour Index No. 42555; Crystal Violet; Fiolet krystaliczny; Gentian Violet; Hexamethylpararosaniline Chloride; Jansiyen Moru; Kristal Viyole; Kristallviolett; Methylrosaniline Chloride; Methylrosanilinii chloridum; Méthylrosanilinium, chlorure de; Methylrosanilinium-chlorid; Metilrozanilinio chloridas; Metilrozanilinyum Klorür; Metylrosaniliniumklorid: Metyylirosaniliniumkloridi: Pyoctaninum Caeruleum; Viola Crystallina. 4-[4,4'Bis(dimethylamino)benzhydrylidene]cyclohexa-2,5-dien-I-ylidenedimethylammonium chloride.

Метилрозанилиния Хлорид

 $C_{25}H_{30}CIN_3 = 408.0$

CAS - 548-62-9

ATC - DOIAE02; GOIAX09.

ATC Vet - QD01AE02; QG01AX09.

NOTE. The name methyl violet-CI Basic Violet 1; Colour Index No. 42535—has been used as a synonym for methylrosanilinium chloride, but is applied to a mixture of the hydrochlorides of the higher methylated pararosanilines consisting principally of the tetramethyl-, pentamethyl-, and hexamethyl- compounds

Pharmacopoeias. In Chin., Eur. (see p.vii), Int., and US. Jpn includes a mixture of hexamethylpararosaniline hydrochloride with the tetramethyl- and pentamethyl- compounds.

Ph. Eur. 6.2 (Methylrosanilinium Chloride). A dark green, hygroscopic, shiny powder. It contains not more than 10% of pentamethyl-p-rosanilinium chloride. It is also known as crystal violet and gentian violet. Sparingly soluble in water; freely soluble in

alcohol and in dichloromethane. Store in airtight containers. USP 31 (Gentian Violet). A dark green powder or greenish, glistening pieces with a metallic lustre, and with not more than a faint odour. Sparingly soluble in water; soluble 1 in 10 of alcohol and 1 in 15 of glycerol; soluble in chloroform; insoluble in ether.

Incompatibility. The antimicrobial activity of methylrosanilinium chloride may be reduced through incompatibilities, decreasing pH, or through combination with organic matter.

The antibacterial activity of methylrosanilinium chloride was inhibited in suspensions of bentonite with which it formed a stable complex.1

Harris WA. The inactivation of cationic antiseptics by bentonite suspensions. Australas J Pharm 1961; 42: 583–8.

Adverse Effects and Precautions

Topical application of methylrosanilinium chloride can produce irritation and ulceration of mucous membranes. Ingestion of methylrosanilinium chloride during prolonged or frequent treatment for oral candidiasis has resulted in oesophagitis, laryngitis, and tracheitis; ingestion may also cause nausea, vomiting, diarrhoea, and abdominal pain. In the UK it is recommended that methylrosanilinium chloride should not be applied to mucous membranes or open wounds. Contact with the eyes or broken skin should be avoided. Methylrosanilinium chloride may stain skin and clothing

Animal carcinogenicity has restricted its use.

Carcinogenicity. Methylrosanilinium chloride has been shown in vitro to be capable of interacting with DNA of living cells, and has demonstrable carcinogenicity in mice.3

Effects on the skin and mucous membranes. Necrotic skin reactions have been reported after the use of topical 1% aqueous solutions of methylrosanilinium chloride;1 areas affected include the submammary folds, gluteal fold, genitalia, and toe-webs. Similar reactions were observed in 2 patients after use of 1% methylrosanilinium chloride or brilliant green on stripped skin.1 Oral ulceration developed in all of 6 neonates treated with aqueous methylrosanilinium chloride 0.5 or 1% for oral candi-

In the UK it is recommended that methylrosanilinium chloride should not be applied to mucous membranes or open wounds.

Effects on the urinary tract. Severe haemorrhagic cystitis rapidly occurred in a 32-year-old woman after accidental injection through the urethra of a solution of methylrosanilinium chloride 1% and alcohol 2%.1 Two cases of severe cystitis were also reported after instillation into the bladder of an undiluted solution containing methylrosanilinium chloride and brilliant green 1:1 (Bonney's blue). Haemorrhagic cystitis has also been reported in a 16-month-old boy after a diluted solution of methylrosanilinium chloride 1% was instilled into his bladder during an inguinal herniorrhaphy.3

- 3. Kim SJ, et al. Hemorrhagic cystitis due to intravesical instilla-tion of gentian violet completely recovered with conservative therapy. Yonsei Med J 2003; 44: 163-5.

Porphyria. Methylrosanilinium chloride has been associated with acute attacks of porphyria and is considered unsafe in porphyric patients.

Uses and Administration

Methylrosanilinium chloride is a triphenylmethane antiseptic dye effective against some Gram-positive bacteria, particularly Staphylococcus spp., and some pathogenic fungi such as Candida spp. It is much less active against Gram-negative bacteria and ineffective against acid-fast bacteria and bacterial spores. Its activity increases as pH increases.

Methylrosanilinium chloride has been applied topically as a 0.25 to 2.0% aqueous solution or as a cream for the treatment of bacterial and fungal infections, but in the UK its use is now restricted to application to unbroken skin because of concern over animal carcinogenicity. It has also been used as a 0.5% solution with brilliant green 0.5% (Bonney's blue) for skin marking before sur-

Preparations

Miramistin

Myramistin. Alkylamidopropylmethylbenzylammonium chloride.

Мирамистин

 $C_{26}H_{47}N_2OCI = 439.1.$ CAS — 126338-77-0; 15809-19-5.

Miramistin is a quaternary ammonium antiseptic used for disinfection of the skin and mucous membranes. It is also included in topical preparations for skin disorders when prone to infection.

Miripirium Chloride (rINN)

Cloruro de miripirio; Miripirii Chloridum; Miripirium, Chlorure de; Myristyl-gamma-picolinium Chloride. 4-Methyl-1-tetradecylpyridinium chloride.

Мирипирия Хлорид

 $C_{20}H_{36}CIN = 326.0$

CAS — 7631-49-4 (miripirium); 2748-88-1 (miripirium chloride).

Miripirium chloride is used as an antimicrobial preservative in some pharmaceutical products.

Hypersensitivity. Two patients who had a delayed hypersensitivity reaction to retrobulbar injection of methylprednisolone ac-etate suspension (*Depo-Medrol*)¹ were found on intradermal testing to be sensitive to methylprednisolone and to miripirium chloride, included as a preservative in the formulation. A similar case of contact allergy has been reported2 in a 56-year-old woman who received an intra-articular injection of methylprednisolone acetate. Patch testing showed allergy to the preservative miripirium chloride.

ATC Vet - QR02AA10.

Miristalkonium chloride is a quaternary ammonium antiseptic with actions and uses similar to those of other cationic surfactants (see Cetrimide, p.1634). It has been used in creams and lotions for disinfection of the skin and has been an ingredient of sprays used for the treatment of minor infections of the mouth and throat. It is also used as a vaginal spermicide.
